# Challenge 5

By: Mosh Hamedani

## Populating and Submitting Forms

Now it's time to connect our vehicle form to our vehicles API. So, this challenge is all about client-side programming.

Here are the requirements that you need to implement:

1- When we navigate to **/vehicles/new**, our vehicle form is in the **new** mode. In this mode, when we click the Save button, the new vehicle should be created on the server.

2- When we navigate to **/vehicles/:id**, the vehicle form is in the **edit** mode. Here, you need to populate the form with the given vehicle. When we click the Save button, the corresponding vehicle should be updated on the server.

3- When in the edit mode, display a button next to the Save button for deleting vehicles. When we click this button, we should see a native JavaScript confirmation box. Once we confirm, the given vehicle should be deleted on the server.

4- Ensure to implement the client-side validation when creating and updating vehicles..

5- Use **ng2-toasty** component to display a toast notification upon saving the vehicle.

If you need to refresh your Angular skills for this section, watch the section called "**Template-driven Forms**" in my Angular course for beginners.
